

ABSTRACT OF THE DISCLOSURE

A packaging container has a container body formed in a shape substantially resembling an inverted cone. The packaging container can be set alone on a support surface and the contents, such as confectionery, of the packaging container can be taken out without holding the packaging container by hand. The container package includes a container body (2) formed in a shape substantially resembling an inverted cone and having a tapered end portion (5) and an open end (6) opposite the tapered end portion (5), a lid (3) for hermetically sealing the container body, and a frustum-shaped exterior shell (4) removably fitted on the container body (2). The exterior shell fitted on the container body is removed from the container body and is inverted, and the tapered end portion of the container body is inserted in the inverted exterior shell to support the container body by the exterior shell. The container body (2) is provided on its outer surface with protrusions (8). The smaller end of the exterior shell engages the protrusions formed on the outer surface of the container body when the exterior shell is fitted on the container body.
